CO₂ Emission Benchmark and Fine Policy (Demo Model)

This project uses a yearly CO₂ benchmark to estimate the emissions exposure of a user. The benchmark is set at 2,500 kg of CO₂ per person per year. This is treated as a reference value for the demo and is not a legal limit or a government regulation.

The policy applies to any vehicle or combination of vehicles registered to the user. The total yearly CO₂ emitted by all vehicles owned by that person is assessed together.

Formula:

$$\text{Fine} = \max(0, \text{Total yearly CO}_2 - 2500) \times 10$$

Where:

- Total yearly CO₂ is measured in kg
- ₹10 is the demo penalty rate per kg of excess CO₂

Example:

If a user emits 3,200 kg of CO₂ in one year:

- Excess CO₂ = 3,200 – 2,500 = 700 kg
- Fine = 700 × 10 = ₹7,000

So the user pays a fine of ₹7,000 for exceeding the yearly CO₂ benchmark.

Important

note:

This is a demo enforcement model for the application and is not a real government policy or legal rule. It is designed to illustrate how emissions-based penalties and compliance checks could work in a user-facing vehicle monitoring dashboard.
